

Legal Operations Performance Dashboard

Portfolio Simulation Project | Power BI | DAX | Data Modeling

Overview

This project simulates an internal analytics dashboard for a large personal injury law firm. It is designed to give firm leadership visibility into **case performance**, **settlement outcomes**, **attorney workload**, and **intake funnel efficiency**.

I built this dashboard end-to-end using synthetic data to reflect realistic operational patterns in a legal environment. The solution highlights my ability to work with multi-table datasets, write advanced DAX calculations, design executive-ready dashboards, and deliver insights that drive decision-making.

Business Questions

This dashboard answers several core operational questions:

- How many cases are active, settled, or stuck in bottlenecks?
- What is the average case duration across the pipeline and per stage?
- Which attorneys have the highest workload and best settlement outcomes?
- How do leads convert through the intake → approval → assignment funnel?
- Which lead sources drive the highest volume and quality of cases?
- What percentage of cases stagnate past SLA thresholds (e.g., >90 days)?

These questions are typical for a litigation or personal injury practice and essential for optimizing staffing, improving intake workflows, and accelerating case cycle times.

Data & Modeling

All data in this project is **synthetic**, generated programmatically to mirror real-world legal operations while maintaining confidentiality.

Tables Used

- **Cases** – case metadata, stage, attorney assigned, filed date
- **Intake** – lead sources, intake dates, approval status
- **Settlements** – settlement amounts, settlement dates
- **Attorneys** – attorney roster & attributes

Model Structure (Star Schema)

Relationships:

- Attorneys[Attorney_Name] → Cases[Attorney_Assigned]
- Intake[Client_ID] → Cases[Client_ID]
- Cases[Case_ID] → Settlements[Case_ID]

This schema supports cross-filtering for attorney workload, settlement rates, and intake-to-case conversion.

Synthetic Data Generation – Example Excel Formulas

Intake Date

=DATE(2023,1,1) + RANDBETWEEN(0,730)

Case_Type

Lookup list

- H2: Auto Accident
- H3: Motorcycle Accident
- H4: Slip and Fall
- H5: Dog Bite
- H6: Uber/Lyft Accident

Then in C2:

=INDEX(\$H\$2:\$H\$6, RANDBETWEEN(1, ROWS(\$H\$2:\$H\$6)))

Lead_Source

Lookup list

- I2: Website
- I3: Phone
- I4: Referral
- I5: Social Media

Then in D2:

```
=INDEX($I$2:$I$5, RANDBETWEEN(1, ROWS($I$2:$I$5)))
```

Tools Used

- **Power BI Desktop** (visuals, relationships, modeling, formatting)
 - **DAX** (KPIs, funnel metrics, percent stuck, avg duration)
 - **Excel** (synthetic dataset generation, codebook)
 - **JSON Theme** (custom Jacoby & Meyers brand styling)
 - **GitHub** (version control, documentation)
-

Key Measures (DAX Highlights)

These measures demonstrate business logic + DAX proficiency:

Total Cases

```
Total Cases = COUNTROWS('Cases')
```

Settlement Rate

```
Settlement Rate =  
DIVIDE(  
    CALCULATE(COUNTROWS('Cases'), 'Cases'[Case_Status] = "Settled"),  
    [Total Cases]  
)
```

Avg Case Duration

```
Avg Case Duration =  
AVERAGE('Cases'[Case Duration Days])
```

Percent Stuck (> 90 days)

```
Percent Stuck per Stage =  
DIVIDE(  
    CALCULATE(COUNTROWS('Cases'), 'Cases'[Case Duration Days] > 90),  
    COUNTROWS('Cases')  
)
```

Funnel Count (Lead → Intake → Approved → Assigned)

```
Funnel Count =  
VAR CurrentStage = SELECTEDVALUE(Funnel_Stages[Stage])  
RETURN SWITCH(  
    CurrentStage,  
    "Lead", COUNTROWS('Cases'),  
    "Intake", COUNTROWS('Cases'),  
    "Approved", COUNTROWS('Cases'),  
    "Assigned", COUNTROWS('Cases')  
)
```

```
CurrentStage,  
"Leads", [Total Leads],  
"Intakes", [Total Intakes],  
"Approved", [Approved Intakes],  
"Assigned", [Assigned Cases]  
)
```

Dashboard Pages

Page 1 — Firmwide Performance Dashboard

- High-level KPIs: Total Cases, Active Cases, Avg Case Duration, Total Settlement Amount, New Cases Per Month
 - New Case Volume Over Time Line Graph
 - Cases by Type Bar Chart
 - Cases by Intake Status Donut Chart
-

Page 2 — Intake and Conversion

- Total Intakes + Leads by Source
 - Intake Approval Rate
 - Intake → Assignment Avg Days
 - Lead-to-case Funnel Chart
 - Intake volume by Agent Bar Chart
-

Page 3 — Attorney Workload

- Attorney slicer + caseload
 - Settlement rate per attorney
 - Avg case duration by attorney
 - Attorney caseload Bar Chart
 - Avg case duration and workload by attorney Scatterplot
-

Page 4 — Case Pipeline and Bottlenecks

- Current Stage slicer + caseload
- Percent stuck per Stage
- Avg days per Stage
- Avg days per Stage Bar Chart
- Total cases by Stage Bar Chart

Insights & Impact

Key Insights Identified:

- How many cases are active, settled, or stuck in bottlenecks?
 - Active Cases: 157
 - Settled Cases: 63
 - Percent Stuck: 56%
- What is the average case duration across the pipeline and per stage?
 - Average Case Duration: 380 days
 - Average Days Per Stage
 - Investigation: 374 days
 - Litigation: 382 days
 - Negotiation: 368 days
 - Settlement: 392 days
- Which attorneys have the highest workload and best settlement outcomes?
 - Highest Workload: Attorney Nguyen
 - Highest Settlement Rate: Attorney Smith
- How do leads convert through the intake → approval → assignment funnel?
 - From Intake to Assigned: 69%
- Which lead sources drive the highest volume and quality of cases?
 - Highest Lead Volume: Referrals
 - Highest Approval Rate: Social Media
- What percentage of cases stagnate past SLA thresholds (e.g., >90 days)?
 - Cases Stagnated: 56%

Impact on Performance:

- Enabled leadership to pinpoint stage-level operational bottlenecks and prioritize process improvements where delay impact is greatest.
- Provided visibility into attorney workload imbalances, supporting more equitable case assignment strategies and potential improvements in throughput.
- Delivered a data-driven understanding of lead volume vs. quality, informing resource allocation and intake optimization decisions.
- Established baseline KPIs for case cycle time, settlement efficiency, and funnel conversion that can be used to measure improvements over time.
- Supported executive decision-making by consolidating fragmented data sources into a single, strategic model of firm-wide performance

About This Project

This was constructed as a portfolio simulation to demonstrate the analytics capabilities I would bring to a legal, operational, or business intelligence role requiring advanced data manipulation, modeling, dashboard design, and executive presentation.
